The present invention is generally directed to recording systems and, more particularly, to a compact disc recorder and player and a method of recording audio information thereon. The compact disc recorder and player has a drive which accommodates a compact disc, a digital to analog converter for converting digital data which is to be recorded on the compact disc to an analog signal, a driving mechanism for driving the compact disc in the drive, a drive button for conveying drive signals to the drive, a playback button for actuating the digital to analog converter to play back the information stored on the compact disc, and a power button for activating the digital to analog converter to convert the data being recorded on the compact disc to an analog signal for playback of the recording on the compact disc.

Various compact disc recorders and players have been designed for use in recording audio information. However, due to the space required to accommodate the drive mechanism, digital to analog converter and other associated hardware, conventional compact disc recorders and players are generally large in size and difficult to transport. In addition, while known compact disc recorders and players can reproduce recorded signals and digitally encoded information, the compact disc recorders and players are generally not well suited for general purpose recording of audio information, and, therefore, information in the form of a compact disc is more generally recorded on media such as tape and not on compact discs. It is thus desired to develop a compact disc recorder and player which can be easily transported by a user. It is also desired to develop a compact disc recorder and player which can be used to record audio information on compact discs. This invention relates generally to video/audio recording apparatus and, more particularly, to an apparatus for recording such signals onto magnetic tape in a helical scanning format. It is known in the prior art that various signals, such as television broadcast signals, can be converted to magnetic video/audio recording media using a magnetic head for recording and a semiconductor video recorder for reproducing. One such example is disclosed in U.S. Pat. No. 3,801,274, issued to P. Kurata on f678ea9f9e
